

KINETIC

Physical therapy, guided by the sensors already in your pocket.

iOS APP CONCEPT · PRODUCT & COMPETITIVE OVERVIEW

The Problem

Home exercise programs fail without real-time feedback

Low Adherence

A large share of patients drift from their prescribed home-exercise routine once they leave the clinic.

No Real-Time Feedback

Without a therapist watching, small form mistakes go uncorrected — and tend to compound over reps.

Cost & Access

Frequent in-person visits aren't affordable or reachable for many patients between appointments.

Re-Injury Risk

Poor form during unsupervised exercise can slow recovery, or cause a new injury altogether.

Introducing Kinetic

Kinetic turns the accelerometer and gyroscope already inside every iPhone into a virtual physical therapist — tracking real exercise reps, range of motion, and form in real time. No extra hardware, no camera, no dedicated device.

- ✓ **Rep counting & exercise tempo**
- ✓ **Range-of-motion (ROM) measurement**
- ✓ **Real-time form-deviation alerts**
- ✓ **Clinician-shareable progress reports**

*Core Motion
Accelerometer + Gyroscope*

How It Works

From prescription to real-time coaching in four steps

Who Else Is In This Space

Digital MSK / physical-therapy apps using motion capture or exercise tracking

App / Company	Motion-Capture Approach	How It's Sold	Gap vs. Kinetic
Sword Health	Proprietary wearable sensor device	Employers & health plans	Requires shipped hardware; not self-serve
Hinge Health	Wearable sensor ("Enso") + camera	Employers & health plans	Enterprise-only; extra device to wear
Kaia Health*	Smartphone camera (computer vision)	Employers, plans & direct access	Needs camera framing, lighting & space
Kemtai	Any camera device (computer vision)	B2B, white-labeled to health systems	B2B only — not available to individuals
Exer Health	Camera-based computer vision	B2B, licensed to providers	B2B only — not a consumer app
OneStep	Phone accelerometer / gyroscope (IMU)	Clinics + a consumer gait app	Built for gait/walking, not exercise reps
Physitrack & similar HEP apps	Video library — no motion tracking	B2B, licensed to clinics	Can't tell if the exercise was done right
Kinetic (this app)	Phone accelerometer + gyroscope (IMU)	Direct App Store download	— the reference point

*Kaia Health was acquired by Sword Health in January 2026; shown here as it operated as a distinct camera-based competitor.

Where Kinetic Fits

Motion-capture method × go-to-market model

ENTERPRISE / EMPLOYER-SOLD

DIRECT-TO-CONSUMER

CAMERA-BASED (COMPUTER VISION)

PHONE MOTION SENSORS (IMU)

What Makes Kinetic Different

The first consumer PT app built entirely on the iPhone's native motion sensors

Zero Extra Hardware

No wearable sensor or dedicated device to buy or ship — unlike Sword Health and Hinge Health.

Full-Exercise Motion Capture

Tracks the actual PT movement in real time — not just a walking gait like OneStep.

Direct-to-Consumer

A straight App Store download — no employer benefit, health plan, or clinic enrollment required.

On-Device Privacy

Motion data is processed on-device; no camera or video stream ever leaves the phone.

Clinical-Grade Metrics

Live rep counts, ROM, tempo, and symmetry scoring, with reports clinicians can review.

Works Anywhere

No lighting, framing, or dedicated space needed — camera-based rivals require both.

Who We're Building For

Ideal Customer Profile (ICP)

THE ICP

The Self-Directed MSK Rehab User

Wants guided, accountable exercise for an MSK injury — without an employer benefit, a webcam, or a clinic visit.

Age 25–59

iPhone owner

No employer MSK benefit

Condition

Currently managing or recovering from a musculoskeletal injury (low back, knee, shoulder, neck) under a home exercise plan.

Device

Owns and primarily uses an iPhone; already comfortable with health and fitness apps.

Coverage Gap

No employer-sponsored digital MSK benefit — still true for roughly 85% of the U.S. workforce.

Privacy Preference

Prefers not to exercise on-camera; wants sensor-based tracking that stays on the device.

Mindset

Motivated to do the work, but adherence drops without structure, feedback, and visible progress.

Sizing the Market

TAM → SAM → SOM for U.S. iPhone owners managing an MSK condition

126.6M

TAM — U.S. adults living with a musculoskeletal condition

↓ ~28% are in active exercise-based treatment this year · 57% own an iPhone · ~85% have no employer MSK benefit

~17M

SAM — iPhone owners in active MSK rehab, no employer benefit

↓ 1–3% realistic direct-to-consumer App Store penetration (Years 1–3)

150K–510K

SOM — Realistic obtainable users, Years 1–3

SAM and SOM are modeled estimates built from the funnel on the next slide, not measured figures.

The Math Behind It

Every filter in the funnel, sourced

Step	Filter Applied	Resulting Population	Source
Start	US adults living with a musculoskeletal condition	126.6M	US Bone & Joint Initiative
× ~28%	Actively receive exercise-based / outpatient PT care annually (≈300M visits ÷ ~8.5-visit avg episode)	≈35M	PT clinic + episode-of-care data
× 57%	Own an iPhone (US iOS market share)	≈20M	US iOS market-share reports, 2026
× ~85%	Have no employer-sponsored digital MSK benefit (only ~10–15% of employers offer one)	≈17M (SAM)	Business Group on Health survey
× 1–3%	Realistic direct-to-consumer App Store penetration, Years 1–3	150K–510K (SOM)	Consumer health-app benchmark

Directional estimates built from publicly available industry and government data — sized to guide product and go-to-market decisions, not a substitute for primary market research.

The Opportunity

Kinetic turns the accelerometer and gyroscope already in your pocket into a clinical-grade physical therapy companion — the direct-to-consumer product missing from a sensor-driven space currently owned by enterprise players.

App Store Launch

Ship a self-serve consumer app with a free tier of core exercise programs.

Clinic Pilot Partnerships

Validate accuracy and outcomes alongside licensed physical therapists.

Clinician Portal & EHR Integration

Let providers assign programs and review progress remotely.
